

## Reverse DNS

---

---

---

---

---

---

---

### Overview

- Principles
- Creating reverse zones
- Setting up nameservers
- Reverse delegation procedures

---

---

---

---

---

---

---

### What is 'Reverse DNS'?

- 'Forward DNS' maps names to numbers  
– svc00.apnic.net -> 202.12.28.131
- 'Reverse DNS' maps numbers to names  
– 202.12.28.131 -> svc00.apnic.net

---

---

---

---

---

---

---

## Reverse DNS - why bother?

- Service denial
  - That only allow access when fully reverse delegated eg. anonymous ftp
- Diagnostics
  - Assisting in trace routes etc
- SPAM identifications
- Registration responsibilities

---

---

---

---

---

---

---

---

## In-addr.arpa

- Hierarchy of IP addresses
  - Uses 'in-addr.arpa' domain
    - INverse ADDRESS
- IP addresses:
  - Less specific to More specific
    - 210.56.14.1
- Domain names:
  - More specific to Less specific
    - delhi.vsnl.net.in
  - Reversed in in-addr.arpa hierarchy
    - 14.56.210.in-addr.arpa

---

---

---

---

---

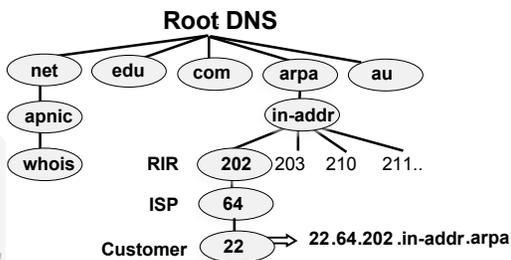

---

---

---

## Principles – DNS tree

- Mapping numbers to names - 'reverse DNS'

---

---

---

---

---

---

---

---

### Creating reverse zones

- Same as creating a forward zone file
  - SOA and initial NS records are the same as normal zone
  - Main difference
    - need to create additional PTR records
- Can use BIND or other DNS software to create and manage reverse zones
  - Details can be different

---

---

---

---

---

---

---

---

### Creating reverse zones - contd

- Files involved
  - Zone files
    - Forward zone file
      - e.g. db.domain.net
    - Reverse zone file
      - e.g. db.192.168.254
  - Config files
    - <named.conf>
  - Other
    - Hints files etc.
      - Root.hints

---

---

---

---

---

---

---

---

### Start of Authority (SOA) record

```

<domain.name.> CLASS SOA <hostname.domain.name.>
<mailbox.domain.name> (
                                <serial-number>
                                <refresh>
                                <retry>
                                <expire>
                                <negative-caching> )
  
```

253.253.192.in-addr.arpa.

---

---

---

---

---

---

---

---

## Pointer (PTR) records

- Create pointer (PTR) records for each IP address

```
131.28.12.202.in-addr.arpa. IN PTR svc00.apnic.net.
```

OR

```
131          IN      PTR          svc00.apnic.net.
```

---

---

---

---

---

---

---

---

## A reverse zone example

```
$ORIGIN 1.168.192.in-addr.arpa.
@      3600 IN SOA test.company.org. (
        sys\admin.company.org.
        2002021301      ; serial
        1h              ; refresh
        30M             ; retry
        1W              ; expiry
        3600 )         ; neg. answ. ttl

NS     ns.company.org.
NS     ns2.company.org.

1      PTR     gw.company.org.
        router.company.org.

2      PTR     ns.company.org.
;auto generate: 65 PTR host65.company.org
$GENERATE 65-127 $ PTR host$.company.org.
```

---

---

---

---

---

---

---

---

## Setting up the primary nameserver

- Add an entry specifying the primary server to the *named.conf* file

```
zone "<domain-name>" in {
    type master;
    file "<path-name>"; };
```

- <domain-name>
  - Ex: 28.12.202.in-addr.arpa.
- <type master>
  - Define the name server as the primary
- <path-name>
  - location of the file that contains the zone records

---

---

---

---

---

---

---

---

## Setting up the secondary nameserver

- Add an entry specifying the primary server to the *named.conf* file

```
zone "<domain-name>" in {
  type slave;
  file "<path-name>";
  Masters { <IP address> ; }; }
```

- <type slave> defines the name server as the secondary
- <ip address> is the IP address of the primary name server
- <domain-name> is same as before
- <path-name> is where the back-up file is

---

---

---

---

---

---

---

---

## Reverse delegation requirements

- /24 Delegations
  - Address blocks should be assigned/allocated
  - At least two name servers
- /16 Delegations
  - Same as /24 delegations
  - APNIC delegates entire zone to member
  - Recommend APNIC secondary zone
- < /24 Delegations
  - Read "classless in-addr.arpa delegation" 

---

---

---

---

---

---

---

---

## APNIC & ISPs responsibilities

- APNIC
  - Manage reverse delegations of address block distributed by APNIC (61/8, 202/8, 203/8, 210/8, 211/8, 218/8, 219/8, 220/8, 221/8, 222/8, 223/8)
  - Process organisations requests for reverse delegations of network allocations
- Organisations
  - Be familiar with APNIC procedures
  - Ensure that addresses are reverse-mapped
  - Maintain nameservers for allocations
    - Minimise pollution of DNS

---

---

---

---

---

---

---

---

### Subdomains of in-addr.arpa domain

- Example: an organisation given a /16
  - 192.168.0.0/16 (one zone file and further delegations to downstreams)
  - 168.192.in-addr.arpa zone file should have:

0.168.192.in-addr.arpa.	NS ns1.organisation0.com.
0.168.192.in-addr.arpa.	NS ns2.organisation0.com.
1.168.192.in-addr.arpa.	NS ns1.organisation1.com.
1.168.192.in-addr.arpa.	NS ns2.organisation1.com.
2.168.192.in-addr.arpa.	NS ns1.organisation2.com.
2.168.192.in-addr.arpa.	NS ns2.organisation2.com.
...	

---

---

---

---

---

---

---

---

---

---

### Subdomains of in-addr.arpa domain

- Example: an organisation given a /20
  - 192.168.0.0/20 (a lot of zone files!) – have to do it per /24)
  - Zone files

0.168.192.in-addr.arpa.
1.168.192.in-addr.arpa.
2.168.192.in-addr.arpa.
...
15.168.192.in-addr.arpa.

---

---

---

---

---

---

---

---

---

---

### Subdomains of in-addr.arpa domain

- Example: case of a /24 subnetted with the mask 255.255.255.192
  - In-addr zone – 254.253.192.in-addr.arpa
  - Subnets
    - 192.253.254.0/26
    - 192.253.254.64/26
    - 192.253.254.128/26
    - 192.253.254.192/26
  - If different organisations has to manage the reverse-mapping for each subnet
    - Solution to follow...

---

---

---

---

---

---

---

---

---

---

### Classless in-addr for 192.253.254/24

- CNAME records for each of the domain names in the zone
  - Pointing to domain names in the new subdomains

```
$ORIGIN 254.253.192.in-addr.arpa.
```

```
0-63 NS ns1.organisation1.com.
0-63 NS ns2.organisation1.com.

1 CNAME 1.0-63
2 CNAME 2.0-63

64-127 NS ns1.organisation2.com.
64-127 NS ns2.organisation2.com.

65 CNAME 65.64-127
66 CNAME 66.64-127
```

---

---

---

---

---

---

---

---

---

---

### Classless in-addr for 192.253.254/24

- Using \$GENERATE (db.192.253.254 file)

```
$ORIGIN 254.253.192.in-addr.arpa.
```

```
0-63 NS ns1.organisation1.com.
0-63 NS ns2.organisation1.com.

$GENERATE 1-63$ CNAME $.0-63

64-127 NS ns1.organisation2.com.
64-127 NS ns2.organisation2.com.

$GENERATE 65-127$ CNAME $.64-127
```

---

---

---

---

---

---

---

---

---

---

### Classless in-addr for 192.253.254.0/26

- Now, the zone data file for 0-63.254.253.192.in-addr.arpa can contain just PTR records for IP addresses 192.253.254.1 through 192.253.154.63

```
$ORIGIN 0-63.254.253.192.in-addr.arpa.
$TTL 1d
@ SOA ns1.organisation1.com. Root.ns1.organisation1.com. (
    1 ; Serial
    3h ; Refresh
    1h ; Retry
    1w ; Expire
    1h ) ; Negative caching TTL

NS ns1.organisation1.com.
NS ns2.organisation1.com.

1 PTR org1-name1.organisation1.com.
2 PTR org1-name2.organisation1.com.
3 PTR org1-name3.organisation1.com.
```

---

---

---

---

---

---

---

---

---

---

### Reverse delegation procedures

- Upon allocation, member is asked if they want /24 place holder domain objects with member maintainer
  - Gives member direct control
- Standard APNIC database object,
  - can be updated through myAPNIC, Online form or via email.
- Nameserver/domain set up verified before being submitted to the database.
- Protection by maintainer object
  - (current auths: CRYPT-PW, PGP).
- Zone file updated 2-hourly

---

---

---

---

---

---

---

---

### Reverse delegation procedures

- Use MyAPNIC to create 'domain' objects
  - Highly recommended
- Or use the web form
  - <http://www.apnic.net/db/domain.html>
- On-line form interface
  - Real time feedback
  - Gives errors, warnings in zone configuration
    - serial number of zone consistent across nameservers
    - nameservers listed in zone consistent

---

---

---

---

---

---

---

---

### Evaluation procedures

- Parser checks for
  - 'whois' database
    - IP address range is assigned or allocated
    - Must be in APNIC database
  - Maintainer object
    - Mandatory field of domain object
  - Nic-handles
    - zone-c, tech-c, admin-c

---

---

---

---

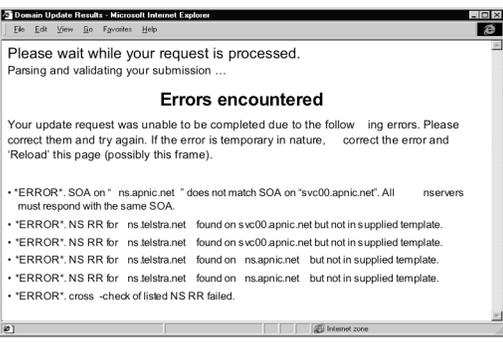

---

---

---

---

## Online errors (also via email)

---

---

---

---

---

---

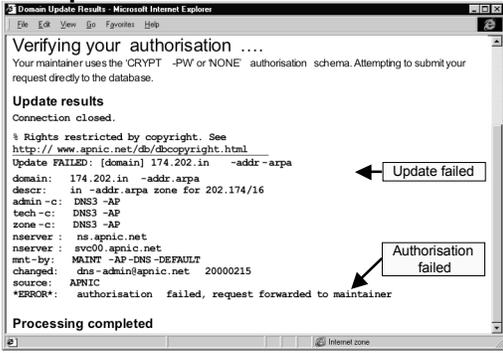

---

---

---

---

## Request submission error

---

---

---

---

---

---

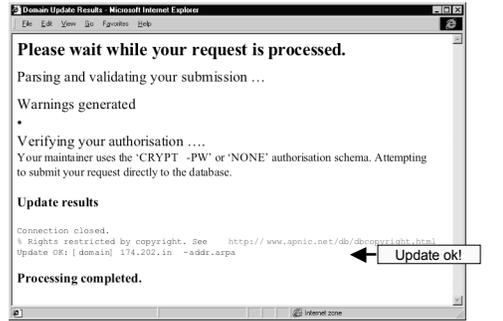

---

---

---

---

## Successful update

---

---

---

---

---

---

---

---

---

---

### Creation of domain objects

- Two options
  - Ask APNIC hostmasters to create the dummy domain objects at the time when the IP allocation is made
  - Do it yourself
- Domain objects protected by maintainers
  - hierarchical protection using “mnt-lower”
  - APNIC protects all the /8’s by MAINT-AP-DNS

---

---

---

---

---

---

---

---

### Creation of domain objects

- When APNIC creates a dummy domain object
  - APNIC hostmasters will include members maintainer object in the respective domain objects
  - Include dummy information in the nameservers attribute
  - Once the domain objects are maintained by members maintainer ID, they can perform any modification to the object

---

---

---

---

---

---

---

---

### Creation of domain objects

- If you opt to create the domain objects yourself
  - Either you can use MyAPNIC
  - Or use web/email templates
- Using web/email templates will result in initial errors
  - As the /8 is hierarchically maintained by MAINT-AP-DNS
  - Contact <helpdesk@apnic.net>

---

---

---

---

---

---

---

---

## Creation of domain objects

- APNIC highly recommend you to use MyAPNIC when creating domain objects
  - MyAPNIC parser will check the maintainer of 'inetnum' object
  - If the password matches no errors will be returned
- Can use MyAPNIC to create multiple domain objects at once
  - ex: If you are allocated a /19, you can provide the full IP range and 32 domain objects can be created in one go

---

---

---

---

---

---

---

---

## Whois domain object

```

domain:      28.12.202.in-addr.arpa
descr:      in-addr.arpa zone for 28.12.202.in-addr.arpa
admin-c:    DNS3-AP
tech-c:     DNS3-AP
zone-c:     DNS3-AP
nserver:    ns.telstra.net
nserver:    rs.arin.net
nserver:    ns.myapnic.net
nserver:    svc00.apnic.net
nserver:    ns.apnic.net
mnt-by:     MAINT-APNIC-AP
mnt-lower:  MAINT-DNS-AP
changed:    inaddr@apnic.net 19990811
source:     APNIC
  
```

---

---

---

---

---

---

---

## Removing lame delegations

- Objective
  - To repair or remove persistently lame DNS delegations
- DNS delegations are lame if:
  - Some or all of the registered DNS nameservers are unreachable or badly configured
- APNIC commenced formal implementation of the lame DNS reverse delegation procedures
  - On 30 September 2004

---

---

---

---

---

---

---

---

### IPv6 Reverse delegations

---

---

---

---

---

---

---

### IPv6 representation in the DNS

- Forward lookup support: Multiple RR records for name to number
  - AAAA (Similar to A RR for IPv4 )
  - A6 without chaining (prefix length set to 0 )
- Reverse lookup support:
  - Reverse nibble format for zone ip6.int
  - Reverse nibble format for zone ip6.arpa

---

---

---

---

---

---

---

### IPv6 forward and reverse mappings

- Existing A record will not accommodate IPv6's 128 bit addresses
- BIND expects an A record's record-specific data to be a 32-bit address (in dotted-octet format)
- An address record
  - AAAA (RFC 1886)
- A reverse-mapping domain
  - Ip6.int (now replaced by ip6.arpa)

---

---

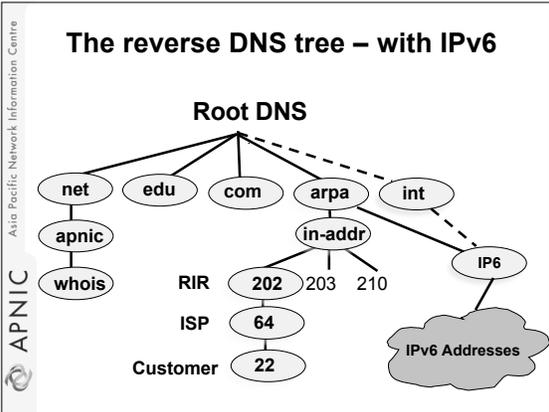

---

---

---

---

---

---

---

---

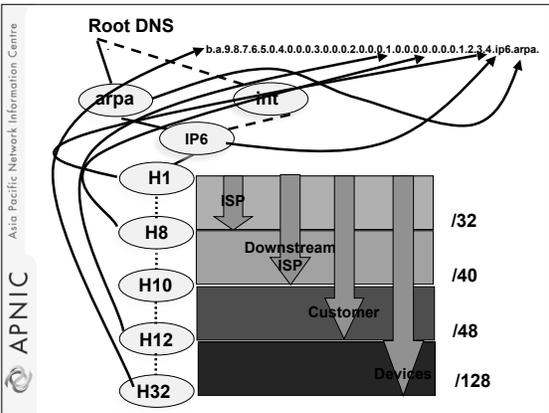

---

---

---

---

---

---

---

---

---

---

---

---

---

Asia Pacific Network Information Centre  
APNIC

### IPv6 forward lookups

- Multiple addresses possible for any given name
  - Ex: in a multi-homed situation
- Can assign A records and AAAA records to a given name/domain
- Can also assign separate domains for IPv6 and IPv4

---

---

---

---

---

---

---

---

## Sample forward lookup file

```

; domain.edu
$TTL      86400
@         IN      SOA      ns1.domain.edu. root.domain.edu. (
          2002093000 ; serial - YYYYMMDDXX
          21600      ; refresh - 6 hours
          1200       ; retry - 20 minutes
          3600000    ; expire - long time
          86400)     ; minimum TTL - 24 hours

; Nameservers
          IN      NS       ns1.domain.edu.
          IN      NS       ns2.domain.edu.

; Hosts with just A records
host1     IN      A        1.0.0.1

; Hosts with both A and AAAA records
host2     IN      A        1.0.0.2
          IN      AAAA     2001:468:100::2

```

---

---

---

---

---

---

---

---

---

---

## IPv6 reverse lookups

- IETF decided to restandardize IPv6 PTR RRs
  - They will be found in the IP6.ARPA namespace rather than under the IP6.INT namespace
- The ip6.int domains has been deprecated, but some hosts still use them
  - Supported for backwards compatibility
- Now using ip6.arpa for reverse

---

---

---

---

---

---

---

---

---

---

## IPv6 reverse lookups - PTR records

- Similar to the in-addr.arpa

```

b.a.9.8.7.6.5.0.4.0.0.0.3.0.0.0.2.0.0.0.1.0.0.0.0.0.1.2.3.4.ip6.arpa.
IN      PTR      test.ip6.example.com.

```

- Example: reverse name lookup for a host with address

```

$ORIGIN 0.6.8.1.1.0.2.0.0.5.0.8.e.f.f.3.ip6.arpa.
1.0.0.0.0.0.0.0.0.0.0.2.4.0.0 14400 IN PTR host.example.com.

```

---

---

---

---

---

---

---

---

---

---

## Questions ?

---

---

---

---

---

---

---
